At least part of one strand (asl) of dsRNA1 is complementary to (I) and at least part of one strand has an overhang of 1-4 nucleotides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. in humans, also genes in plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into dsRNA greatly increases effectiveness for inhibiting gene expression, both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of

Inhibiting expression of t by introducing into cells to the target.

target genes, useful s two double-stranded

e.g. RNAs

for treating tumors, that are complementary

The invention relates to inhibiting expression of a target gene in a cell by introducing at least two oligoribonucleotides (dsRNAI and II), both with a double-stranded (ds) structure of at most 49 sequential nucleotide

At least part of one strand (S1, S2) of the ds structures in each of dsRNAI and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded RNA inhibition (RNAi). The method is particularly used to treat tumours or infections, especially by Plasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the end, stability (and thus effective concentration in the cell) is improved and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the invention Sequence 3399 BP; 550 A; 1157 C; 1089 G; 603 T; 0 U; 0 Other; No.: 141 221 601 201 541 181 481 161 421 361 121 301 TTCGCGCTGCTGGACGGGGCCCGCGGGGGCCCCCCGAGGCCTTCACCACCAGCGTGCGC 101 241 121 81 ValAlaArgValLeuGlnArgLeuCysGluArgGlyAlaLysAsnValLeuAlaPheGly 61 AspAlaArgProProProAlaAlaProSerPheArgGlnValSerCysLeuLysGluLeu 41 ArgGlyAspProAlaAlaPheArgAlaLeuValAlaGlnCysLeuValCysValProTrp 13 21 ValLeuProLeuAlaThrPheValArgArgLeuGlyProGlnGlyTrpArgLeuValGln _ GlyAlaAlaProGluProGluArgThrProValGlyGlnGlySerTrpAlaHisProGly AlaArgArgArgGlyGlySerAlaSerArgSerLeuProLeuProLysArgProArgArg ArgAlaTrpAsnHisSerValArgGluAlaGlyValProLeuGlyLeuProAlaProGly AlaThrGlnAlaArgProProProProHisAlaSerGlyProArgArgArgLeuGlyCysGlu LeuValAlaProSerCysAlaTyrGlnValCysGlyProProLeuTyrGlnLeuGlyAla CTGCGCCGCGTGGGCGACGACGTGCTGGTTCACCTGCTGGCACGCTGCGCGCTCTTTGTG LeuArgArgValGlyAspAspValLeuValHisLeuLeuAlaArgCysAlaLeuPheVal AGCTACCTGCCCAACACGGTGACCGACGCACTGCGGGGGAGCGGGGGCGTGGGGGCTGCTG SerTyrLeuProAsnThrValThrAspAlaLeuArgGlySerGlyAlaTrpGlyLeuLeu PheAlaLeuLeuAspGlyAlaArgGlyGlyProProGluAlaPheThrThrSerValArg GTGGCCCGAGTGCTGCAGAGGCTGTGCGAGCGCGCGAAGAACGTGCTGGCCTTCGGC CGCGGGGACCCGGCGCTTTTCCGCGCGCGCTGGTGCCCAGTGCCTGGTGTGCCTTGG GTGCTGCCGCTGGCGACGTTCGTGCGGCGCCCTGGGGGCCCCAGGGCTGGCGGCTGGTGCAG ATGCCGCGCCCCCCCCCCGCAGCCGAGCCGCTCCCTGCTGCGCAGCCACTACCGCGAG MetProArgAlaProArgCysArgAlaValArgSerLeuLeuArgSerHisTyrArgGlu GCGAGGAGGCGCGGGGCAGTGCCAGCCGAAGTCTGCCCGATGCCCAAGAGGCCCAGGCGT CGGGCCTGGAACCATAGCGTCAGGGAGGCCGGGGTCCCCCTGGGCCTGCCAGCCCCGGGT GCCACTCAGGCCCGGCCCGCCACACGCTAGTGGACCCCGAAGGCGTCTGGGATGCGAA 2.38e-218 5961.00 100.00% 100.00% Length: Matches: Gaps: Conservative: Mismatches: Indels: 3399 1132 0 0 0 180 260 240 660 600 200 160 420 140 360 300 100 240 80 60 120 40 60 720 220 540 480 180

This invention describes a novel method for inhibiting expression of a target gene by introducing into the cell that contains the target gene least one oligoribonucleotide (dsRNAI) that has a double-stranded (ds) structure of not more than 49 consecutive nucleotides (nt), where at least a segment of one strand of the ds structure is complementary with

The method is used to inhibit expression of target genes, particularly oncogenes, cytokine genes, Id (not defined) protein genes, developmental or prion genes, or genes expressed in pathogenic organisms (particularly plasmodia) or in viruses or viroids (pathogenic in humans, animals or plants). Treating the cells with interferon greatly increases the extent to which dsRNA can inhibit expression of the target genes, and the effect is even greater when defare modified to increase their stability. ABX09936-ABX10075 represent gene fragments used to illustrate the method of the invention

XX ITA The invention relates to a method for inhibiting expression of a target gene (ABL9158-ABL91797) in a cell by introducing at least one oligoribonucleotide that has a double-stranded structure consisting of most 49 sequential nucleotide pairs, with at least part of one strand complementary with the target gene and has at least one end a single-

The method provides oligoribonucleotides for antisense inhibition of gene expression useful e.g. for treating tumours but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. Plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against cytokine, Id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known oligonucleotides, probably because the unpaired overhang increases stability and thus intracellular concentration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   181

A composition of the invention has cytostatic, and immunostimulant activity. The protein or the nucleic acid encoding the protein is useful in the manufacture of a medicament for the treatment of cancer in a human or for eliciting a cytotoxic T cell response in a human.

Sequence 3798 BP; 613 A; 1311 C; 1212 G; 662 T; 0	CC therapputically as inhibitors. Nucleic actual requests and contemplated CC diagnostic probes for detecting/quantifying TP2 DNA. Also contemplated CC are transgenic animals in which the TP2 gene has been inactivated or is CC overexpressed. TP2 polypeptides are administered i.v., s.c. or orally, or CC they are delivered from engineered cells or gene therapy vectors.	CC activity, e.g. for treatment of cancer. Its polypeptimes win and concern to screen for agents that inhibit TP2 activity or its binding to TRIP1 CC (see AAW61347) or telomerase RNA, potentially useful therapeutically, CC also to raise specific antibodies useful in immunoassays and CC also to raise specific antibodies useful in immunoassays and concern to the con	CC LIM1803 CDMA. EXPRESSING FA General Control of CC telomerase activity and thus proliferation for treatment of e.g. HIV CC infection, AIDS and ageing disorders, while expressing an inactive mutant CC of TP2 (or molecule antisense to the gene) is used to decrease telomerase CC of TP2 (or molecule antisense to the gene) is used to decrease telomerase	CC This full-length character to the telemerase complex. The sequence CC see AAW61350), a novel protein of the telemerase complex. The sequence CC was deduced from overlapping partial clones #32 (see AAV27872) and TP2-15 CC (see AAV27875), which were obtained from a human colon tumour cell line CC (see AAV27875).	c.,

The present invention also compound is a ribonucleoprotein. The present invention also compound compounds the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant compound; (B) crotein or polynucleotide, on administration of the compound; (B) compound; (C) detecting the recombinant telomerase by contacting a protein preparation of hTRT with a telomerase RNA component; (C) detecting the complex formed or in the case of RNA detection, amplifying compound to the sample and correlating the presence of complex or amplification compound that in the sample, and (D) increasing the compound that inhibits expression; and (E) concliferation of a vertebrate cell by increasing hTRT expression; and (E) concliferation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polynucleotide encoding hTRT can be used in the manufacture of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity can be used to treat conditions that are associated with high telomerase activity. A protein preparation of hTRT can also be used in the new methods
                                                                                                                                                                                                                                                                                                                                                                                                                               Ś

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-10-044-692-2 (1-1132) x AAZ00724
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel method for the quantitation of tumour cells in a body fluid which comprises (1) enrichment or isolation of tumour cells in the sample, (2) amplification of mRNA from these cells that encodes the catalytic subunit of telomerase and (3) quantifying the amount of amplified mRNA. The method is applied to tumour cells derived from (micro)metastases, e.g. associated with a wide range of tumours such as T-cell lymphoblastoma, chronic myeloid or acute lymphatic leukemia, melanoma, pulmonary carcinoma, cancer of colon or breast etc. This sequence encodes a human telomerase protein catalytic domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Quantifying tumor cells of telomerase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 1999-431408/37
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 04-FEB-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is the nucleotide sequence of cDNA encoding human telomerase reverse transcriptase (hTRT, see AAY32090). Human telomerase is a target for diagnosting and treating diseases relating to cell proliferation and senescence, such as cancer, or for increasing the proliferative capacity of a cell. A claimed method for increasing the proliferative capacity of a vertebrate cell, especially a human or other mammalian cell, involves introducing into the cell a recombinant hTRT polymucleotide encoding an hTRT variant in which residues 192-323, 200-323, 192-271, 200-271, 222-240, 415-450, 192-323 and 415-450, or 192-271 and 415-450 are deleted. A claimed method for reducing telomerase activity in a cell involves introducing a recombinant polymucleotide encoding an hTRT variant having a deletion of amino acids 192-450, 560-565, 637-660, 638-660, 748-764 or 1055-1071. The polymucleotides are obtained by mutagenesis of the hTRT coding are compared.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         31-MAR-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence encodes a human telomerase reverse transcriptase (TRT) polypeptide. The protein is used in the method of the invention. The specification describes a method for activating a T lymphocyte, comprising contacting the T lymphocyte with a dendritic cell that comprising TRT peptide in the context of a MHC class I or MHC class II molecule. The protein causes induction of an in vivo immunological cresponse to telomerase activity. Cancer cells are characterized by expression of endogenous TRT gene and the presence of detectable cellomerase activity. Therefore, by eliciting a specific immune response to TRT or to TRT-expressing cells, it is possible to selectively target croliferating cells for immune response to telomerase by activating a T cellotting an in vivo immune response to telomerase by activating a T clymphocyte, and is useful for prevention and treatment of cancers and other proliferation diseases/conditions

The method is useful for detecting the presence of beta-region (a 182 nucleotide region consisting of exons 7 and 8) of the hTERT-mRNA in a human sample for diagnosis and prognosis of cancer. The method provides an accurate measure of telomerase activity by selectively measuring mRNA that encodes an active hTERT protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Quantitating expression of mRNA encoding hTERT, the catalytic subunit of telomerase, as an indicator of cancer, by amplifying RNA using primers complementary to hTERT gene sequence and quantitating amplified products
